

# The Virtual Flight Test Environment – A Web-Based Framework for Realistic Testing of Flight Control Laws

Janik Hopf  
*AlphaLink Engineering GmbH*

# ::: Challenges in the Operation of UAS

## Worldwide Market Growth for Commercial UAVs

## A Growing Market needs Professionalisation

-  **Airspace Integration**
-  **Intensive Testing**
-  **Safe UAS-Systems**
-  **Professional and practise-oriented teaching**
-  **Safe and Reliable Flight Control Law Software**
-  **Quick transfer from research to application**

- 

# ::: Virtual Flight Test Environment as a Teaching and Research Platform

## Performing of Flight Tests exclusively in the Web Browser

- Virtual flight test environment is a flight simulation that only requires a web browser
- No further software is necessary
- Control is possible with joystick or keyboard
- It can be flown without control law, with predefined control law structures or with own flight control laws

## Concept of the Virtual Flight Test Environment

## ::: Usable UAS in the Virtual Flight Test Environment

### Digital Twin of the Flying Lab

- Flying Lab is used by universities in teaching and research for experiments in flight dynamics and flight control
- Implementation of Simulink controllers on the real flight test vehicle without writing a line of code
- Controllers designed in the virtual flight test environment can be flown directly on the real aircraft with the same performance

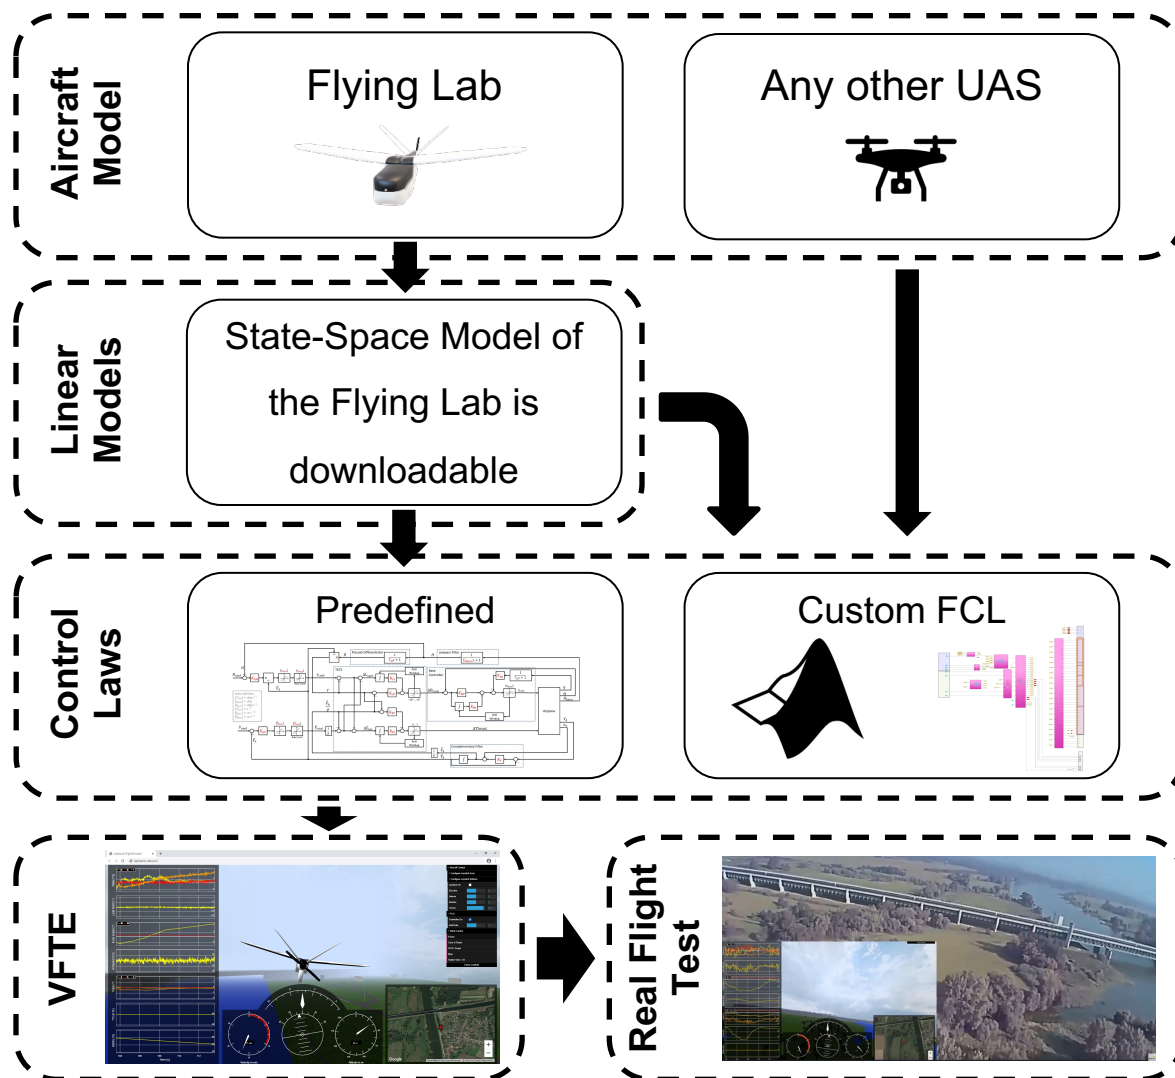

### Other implementable UAS & Environment

- In principle, any aircraft, e.g. copter, can be integrated into the virtual flight test environment
- In addition to a generic world (low performance required), the landscape of the waterbridge in Magdeburg is available as an environment.
- Further environments are planned

## ::: Process Chain and Application Examples

### Process Chain for Development and Testing of FCL-Software

### Application Examples

1. Design of a controller for a predefined control-loop structure (Bank Angle Control Law)
2. Implementation of a custom control law in the Virtual Flight Test Environment
3. Download of the controller and validation with the Hardware-in-the-Loop Simulator and in real flight tests

# ::: Example 1: Design of a Controller for a Predefined Control Law Structure

## Virtual Flight Test Environment

### How to use the Virtual Flight Test Environment

This video explains the interaction with the virtual flight test environment. It shows how to set up your joystick and how to access the flight test data.

**Battery Recharging**  
99.3 %

**Actual Control Surface Deflections**  
Elevator: -0.2°  
Aileron: -1.7°  
Rudder: 1.3°

**Aircraft Control**  
Configure joystick axes

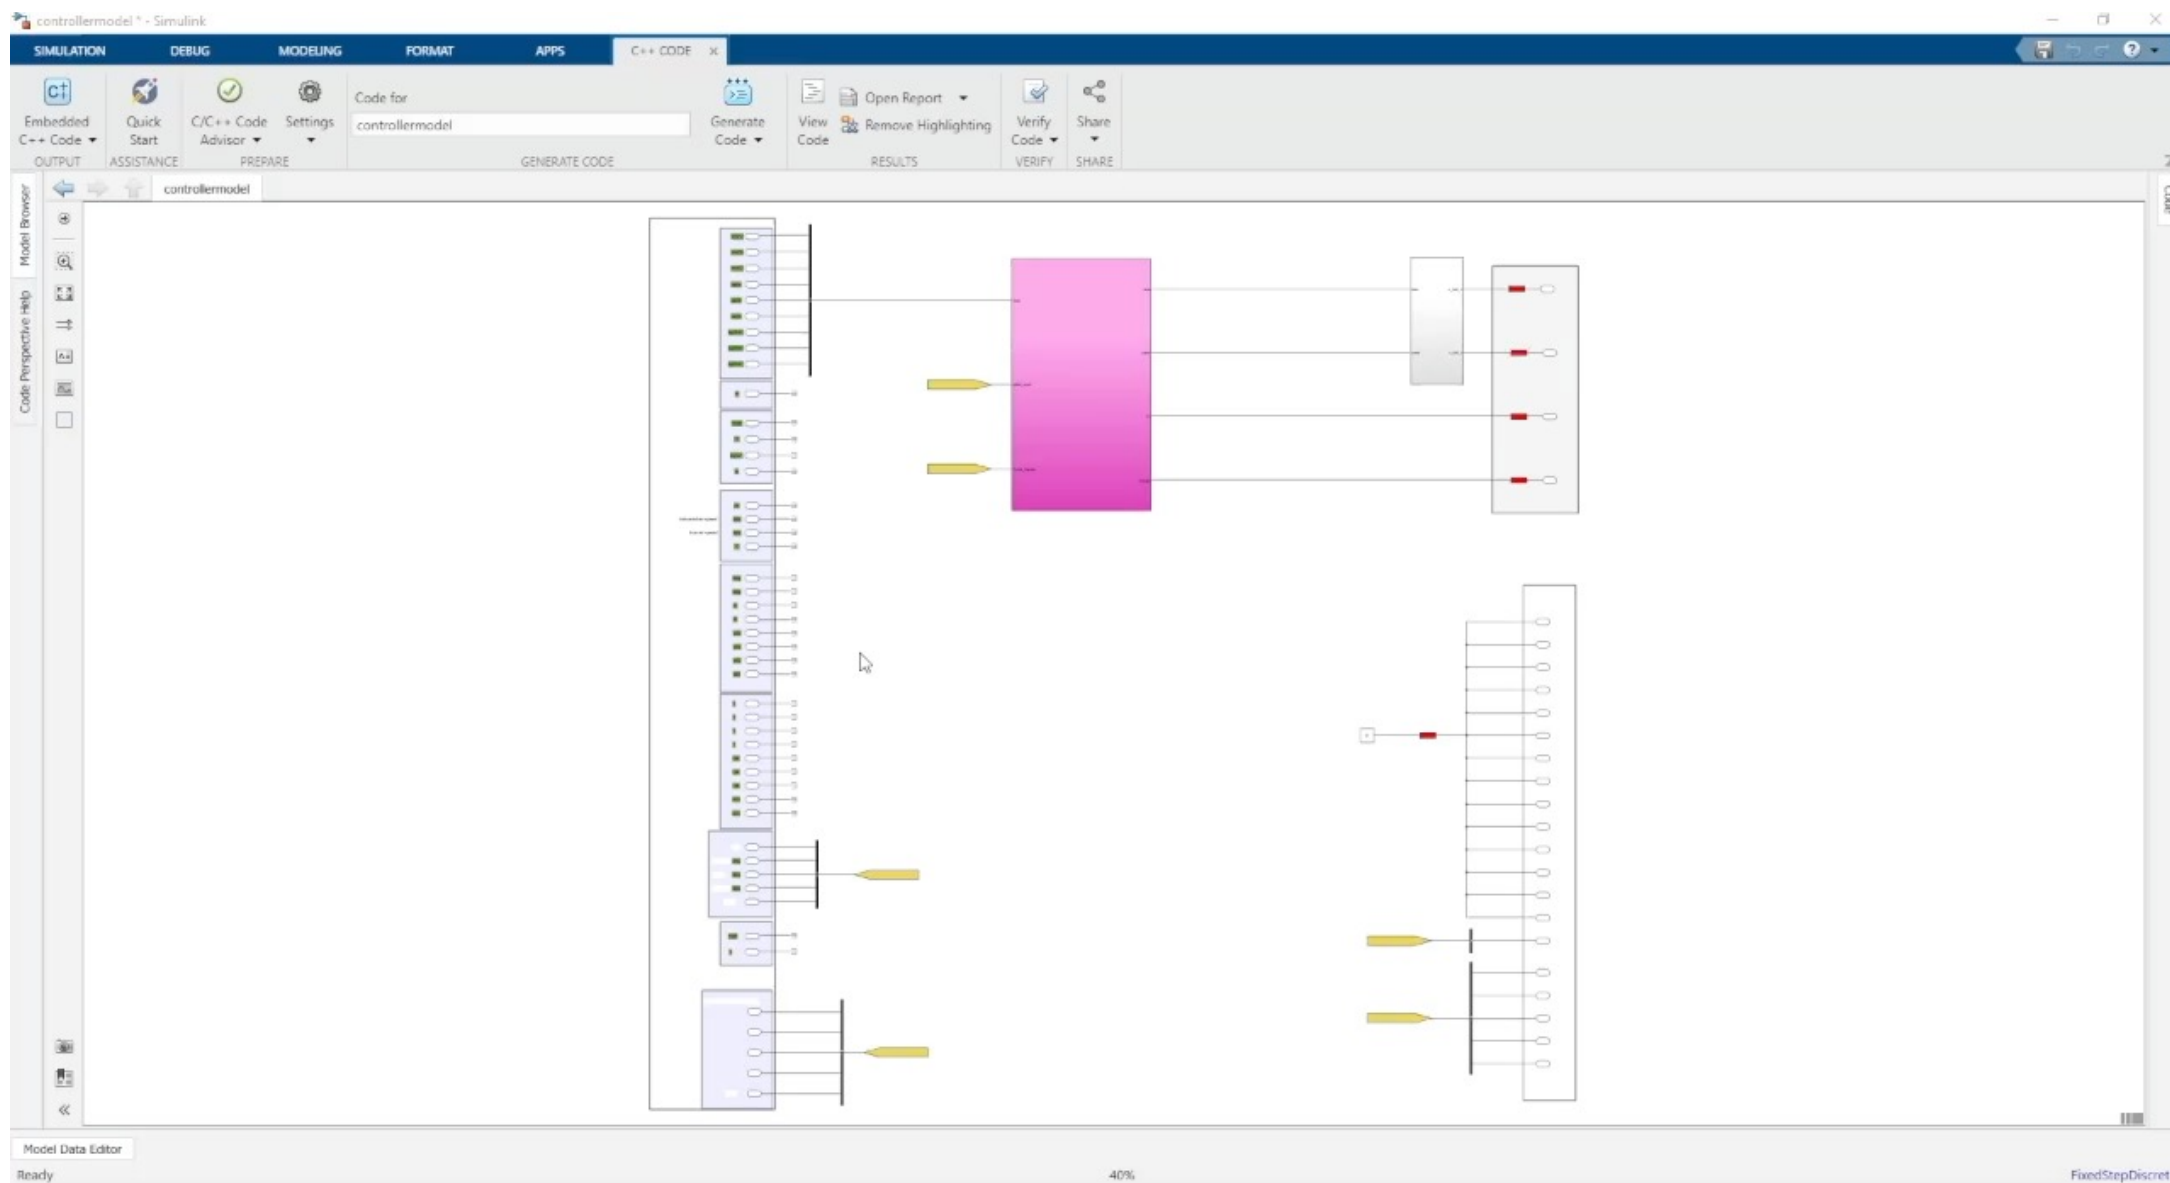

**Joystick Channels**  
Elevator Channel: 1  
Aileron Channel: 0  
Rudder Channel: 0  
Thrust Channel: 0

**Event Controls**  
Joystick On:   
Elevator: 0.00  
Aileron: 0.00  
Rudder: 0.00  
Thrust: 0.00

**Virtual Control**  
Start  
Pause  
Reset  
Switch View  
Open Controls

Velocity in m/s  
Altitude in m

### Lesson 12 - Full Autopilot

**Explanation:**  
This control law allows fully automatic flight. The course, altitude, and airspeed are set via the Flight Control Unit. The control law combines the previously designed controllers, thereby allowing to use the tuned parameters from the previous lessons.  
⚡ This document lists all variables saved in the Excel sheet of this lesson.

## ::: Current Users and Invitation to test the Web Environment

### Current Users

#### Germany

- Technische Universität Berlin
- Technische Hochschule Wildau
- TU Hamburg
- TU Chemnitz
- Hochschule Karlsruhe
- Universität Rostock
- Deutsches Zentrum für Luft- und Raumfahrt
- Private users

#### International

- Brazil
- Bulgaria
- Chile
- Columbia
- Great Britain
- USA

### Join the Network

Register today: [www.alphalink-vfte.com](http://www.alphalink-vfte.com)

Promotion Code: *eurognc\_2021*

Test all functionalities of the VFTE one week (until 14.10.2021)

## ::: Summary and Suggestions for Discussion

### Summary

- The virtual flight test environment can be used for engineering education, where students are faced with real flight test problems (noise, bias)
- Scientists can implement their own new control concepts and test them before the flight test
- Due to the equivalence between model and real flight and system behavior, intensive testing is possible prior to the real-world flight test
- With the connection to the hardware-in-the-loop simulator, the flight control law software can be securely and intensively tested for error cases (e.g. sensor error) before the flight test

### Questions for the audience

- As a user, what other functionalities would you like to see?
- Do you have any suggestions for the current state?
- What do you think about a networked version of the virtual flight test environment? Can you imagine testing your guidance, navigation and control solutions virtually with other users/researchers?
